

Module 10. Standards and assessment evidence

DeepCyber AI Red Teaming · AMLUCS 2026 · Source versions checked 14 September 2026

The documents

The UK AI Cyber Security Code and Implementation Guide provide a baseline and examples. ETSI published TS 104 223 as a Technical Specification, followed by EN 304 223 V2.1.1 as a European Standard. The EN contains 13 principles across five lifecycle phases.

TR 104 128 explains implementation. Version 1.1.1 is published; the supplied revision V2.0.3 is a draft. TS 104 216 V0.0.8 is the supplied draft assessment method. Defining a certification scheme is outside its scope.

The EN is voluntary as a standard. Its provisions distinguish requirements, using shall, from recommendations, using should. Publication alone does not establish AI Act conformity.

Claims, information and verdicts

ICS, Implementation Conformance Statement: applicable provisions and the organisation's claims. Exclusions need reasons.

IXIT, Implementation eXtra Information for Testing: information and evidence needed to assess those claims. The draft describes grey-box testing through offered interfaces with partial design knowledge.

Verdicts: pass, fail or inconclusive, judged against the relevant criteria. A fail takes precedence when results are combined. The harness's effect states do not map automatically to assessment verdicts.

What to retain

Record the requirement, scope, tested version and permissions. Preserve the method, criterion, conversation and relevant execution or content evidence. Include the finding, mitigation owner, retest and limitations.

M09-C01 records five deleted rows followed by reseeding. It does not establish permanent loss or an effective disposal control. It contributes to assessment of permissions, testing and logging under EN 5.1.2-6, 5.2.5 and 5.4.2.

Four closing questions

1. Which requirement was assessed?
2. Which system and version were covered?
3. What evidence supports the conclusion?
4. What change would require reassessment?

Regulatory context and further reading

AI Act scope depends on the system and provider. Article 55's explicit adversarial-testing obligation concerns systemic-risk GPAI providers. DORA and FCA scenario testing apply within their respective scopes. A course test alone does not constitute DORA TLPT.
